How to run:

Backend:

It is preferable to use <http://localhost:8080> to run the backend on. **But** it is not fixed to just that, if you are running it on a different server or port or both please change the following values in the frontend folder in `main.js` file for both lines 4 and 5 to the server and port you are using like the following:

```
4  
5  
backendServer: 'localhost',  
backendPort: '8080',
```

Frontend:

The server I used to run Frontend is <http://127.0.0.1:3000> , **But** it is not fixed to just that, if you are running it on a different server and port or both please change the following value in the file `CalculatorController.java` in line 7 to the server and port you are using like the following:

```
5 //If you are using a different server and port  
6 //Please change this http://127.0.0.1:3000 to it  
7 @CrossOrigin(origins = { "http://127.0.0.1:3000"})  
8 @RestController
```

Thanks.
